Chapter 1: Getting started with debugging

Remarks

This section provides an overview of what debugging is, and why a developer might want to use it.

It should also mention any large subjects within debugging, and link out to the related topics. Since the Documentation for debugging is new, you may need to create initial versions of those related topics.

Examples

Example debugging tool chain for user mode debugging on Windows

- Visual Studio (IDE)
- [WPA](#) (performance analyzer)
- [WinDbg](#) (debugger)
- [IDA Pro](#) (disassembler)
- [dotPeek](#) (decompiler for .NET)
- [WinMerge](#) (diff tool)
- [HxD](#) or [010 editor](#) (hex editor)
- [Speedcrunch](#) (calculator)
- [Firefox](#) (browser)
- [Rohitab API monitor](#) (API call monitoring)
- SOS (a WinDbg extension for .NET)
- [SOSex](#) (another extension for WinDbg)
- [Agent Ransack](#) (file content search)
- [WSCC](#) (collection of SysInternals and Nirsoft tools)
- [Debug Diag](#) (diagnosis tool)
- [Application verifier](#) (runtime analysis tool)
- [Dependency walker](#) (DLL dependency analysis tool)
- [Stud_PE](#) (PE file analysis tool)

Chapter 2: Understanding System Error/Exit Codes in Windows

Remarks

For this process to work, the original error/exit code should start with `0x8007` which generally is an indication it originated from a valid Win32 process.

However, should no message appear, then it probably didn't originate from a Windows process and therefore, will need to be examined further outside the steps mentioned above.

Examples

Converting exit codes into meaningful messages

Being able to understand Error/Exit codes is a fundamental skill for developers on Window's machine. Yet for many, the cryptic hexadecimal code that can be produced on an application exiting with on error can prove to be time consuming and painstaking process for the developer to track down and isolate.

For instance, on SO, there are several thousand questions all asking about the meaning of what a particular error/exit code means... and as an example, below is one such exit code

The program '[4432] program.exe' has exited with code -2147023895 (0x800703e9).

Therefore, in order to identify the cause of the issue we need to convert the exit/error code into something more meaningful and we can do this by undertaking the following process.

1. From the error code `0x800703e9`, take the last 4 characters `03e9`
2. Using a [Hexadecimal to Decimal Converter](#), convert `03e9` to its decimal counterpart, which in this case is `1001`
3. Using `cmd`, type `net helpmsg 1001` or whatever decimal value is returned from step 3.
4. A friendly error message should appear that can help identify the cause of the issue, which in this instance, the error returned was `Recursion too deep; the stack overflowed.`
