# Chapter 1: Getting started with google-chrome

## Remarks

Google Chrome is a web browser available on desktop (Windows, ChromeOS, MacOS, Linux) and mobile (Android, iOS) platforms.

Web Developers should understand Chrome's frequent release cycle, multiple version channels, developer tools, and extension apis.

## Examples

### Installation or Setup

**Install Chrome** by first considering which **version** to use, relevant if you are going to be doing Web Development:

Google Chrome releases major versions about every 6 weeks and provides access to multiple versions of the product as they are being stabilized. This process is done in a series of **channels**.

- **Stable Channel** is the version released to all users, it is the default installation experience. It receives security updates as needed.
- **Beta Channel** is where the next major version is stabilized for approximately 1 month before moving to Stable. It is updated roughly weekly.
- **Dev Channel** is very close to the latest code, with minimal testing. It is updated 1 or 2 times a week.

A desktop installation of chrome can be moved from Stable to Beta or Dev in Chrome's preferences.

The **Canary** build undergoes minimal testing and is released daily. It provides access to the latest code and can be installed at the same time as a stable, beta, and dev versions of Chrome.

**Install** by following links to your choice of **Stable** (and then modifying it to Beta or Dev) or **Canary**. On Android and iOS, use the respective Play / App Store.

---

Steps to install:

1. Downloading Chrome For [PC/Mac/Linux](#)
2. Click "Download Chrome". This will open the Terms of Service window.
3. Determine if you want Chrome as your default browser.

- If you set it as the default browser, it will open whenever a link for a webpage is clicked in another program, such as email.
  - You can opt to send usage data back to Google by checking the box labeled “Help make Google Chrome better...” This will send back crash reports, preferences and button clicks. ***It does not send any personal information or track websites.***
4. Click “Accept and Install” after reading the Terms of Service. The installer will start and you will have Google Chrome installed when it has finished.

## Extensions

Google Chrome supports **extensions** that augment the way the browser works. They can add functionality to web pages or to the browser UI. Any developer can create an extension and list it in the Chrome Web Store.

See more on the [extensions](#) page.

---

# Chapter 2: Chrome DevTools

## Remarks

[Chrome DevTools product documentation.](#)

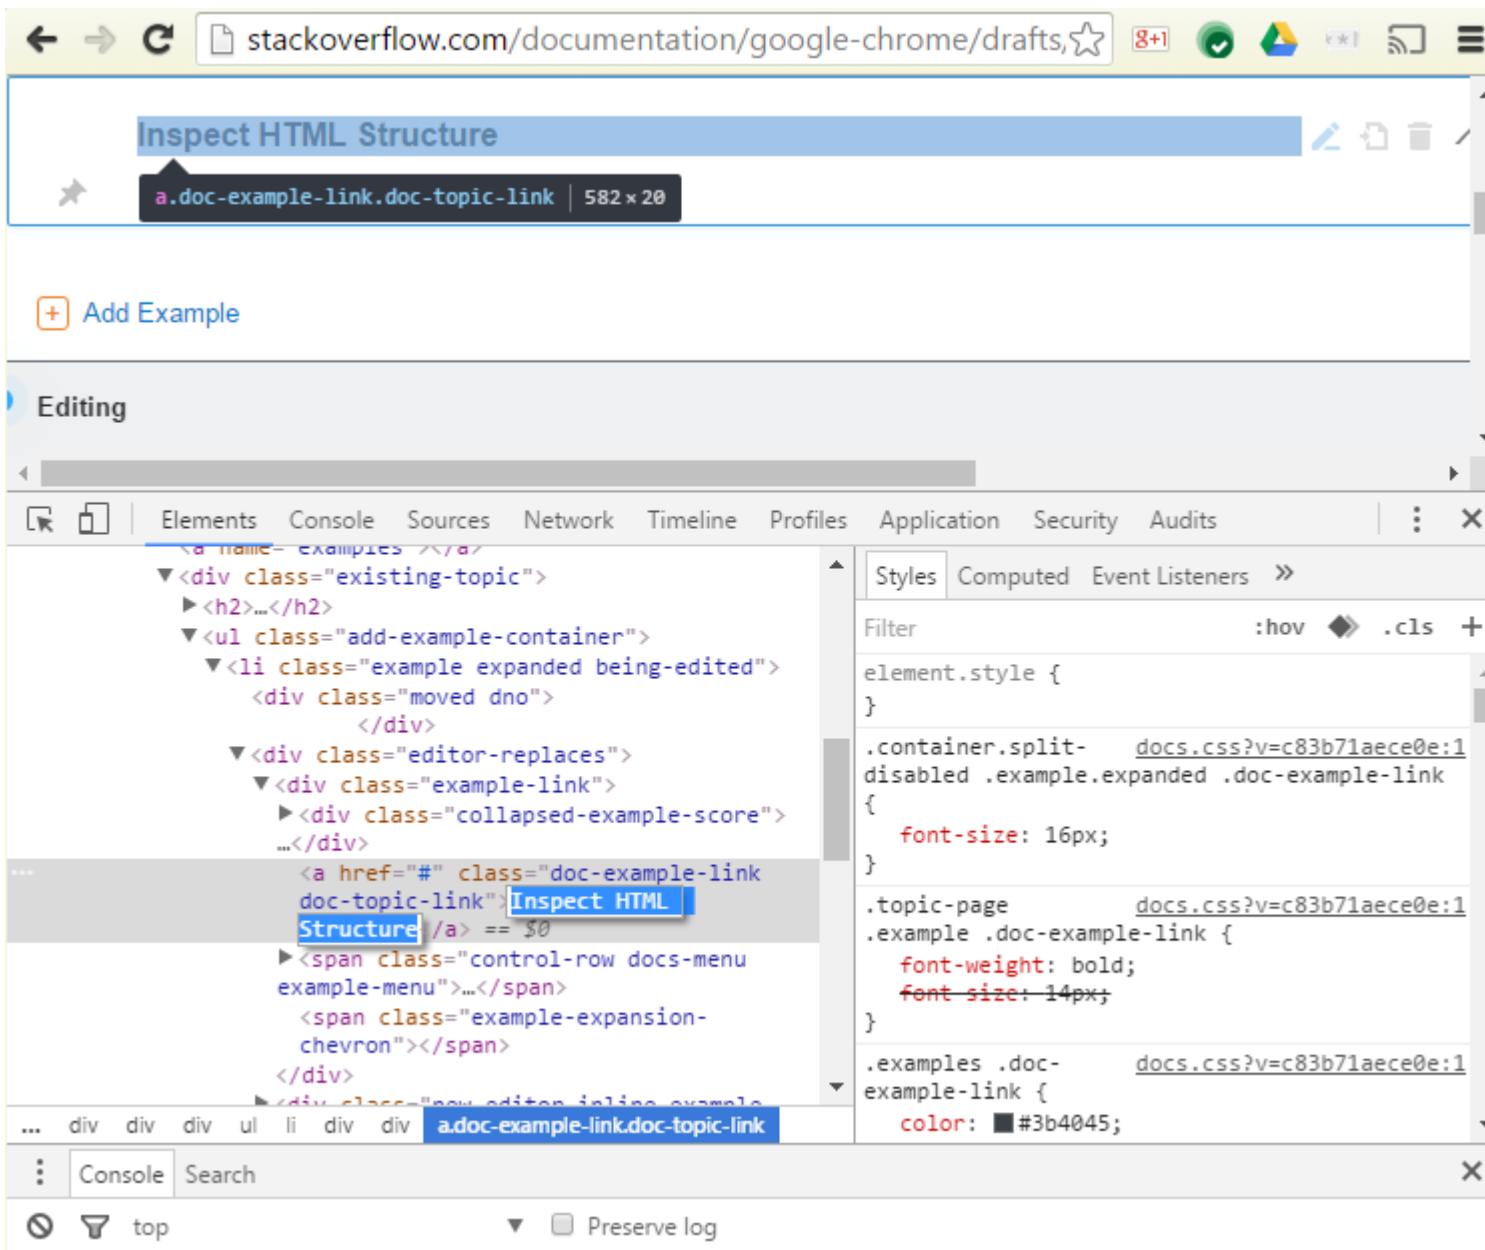

## Examples

### Inspect HTML Structure

On a desktop version of Chrome, the contents of the page can be inspected. This shows the document object model (DOM) of the HTML, the Cascading Style Sheet styles (CSS), and much more.

Enter inspection by one of many options:

- Right click on a web page, and select **Inspect**
- From the Chrome Menu, select **More Tools, Developer Tools**
- Use a keyboard shortcut, e.g. Ctrl+Shift+I on Windows.

## DOM node index(\$0, \$1, etc.. )

In Google Chrome's developer tools "Elements", you can see that the selected line shows `==$0` that is the DOM node index(as shown below):

```
<!DOCTYPE html>
<html itemscope itemtype="http://schema.org/QAPage" > == $0
  <head>...</head>
  <body class="ask-page new-topbar">
    <noscript><div id="noscript-padding"></div></noscript>
    <div id="notify-container"></div>
    <div id="overlay-header"></div>
    <div id="custom-header"></div>
    <div class="topbar">...</div>
    <script>
      StackExchange.ready(function() { StackExchange.topbar.init(); });
    </script>
    <div class="container">...</div>
    <div id="footer" class="categories">...</div>
    <noscript>...</noscript>
    <script>...</script>
    <div id="window-resizer-tooltip" style="display: none;">...</div>
  </body>
</html>
```

html body.ask-page.new-topbar div#custom-header

\$0 returns the most recently selected element or JavaScript object, \$1 returns the second most recently selected one, and so on.

This is useful in debugging. The \$0, \$1, \$2, \$3 and \$4 commands work as a historical reference to the last five DOM elements inspected within the Elements panel or the last five JavaScript heap objects selected in the Profiles panel.

---

# Chapter 3: Chrome Extensions

## Remarks

Google Chrome supports [extensions](#) that augment the way the browser works. They can add functionality to web pages or to the browser UI.

## Examples

**Browser Action running executeScript on a page.**

### manifest.json

```
{
  "name": "Hello Page",
  "description": "Add 'Hello' to the current page.",
  "version": "1.0",
  "permissions": [
    "activeTab"
  ],
  "background": {
    "scripts": ["background.js"],
    "persistent": false
  },
  "browser_action": {
    "default_title": "Say Hello on this page"
  },
  "manifest_version": 2
}
```

### background.js

```
chrome.browserAction.onClicked.addListener(function(tab) {
  chrome.tabs.executeScript({
    code: 'document.body.insertAdjacentText("beforeBegin", "Hello!")'
  });
});
```

---

# Chapter 4: Headless browsing

## Introduction

Chrome supports headless browsing that's exposed through a switch that can be used when starting the process. This enables opening pages without creating a browser window, thus a graphical environment is not required.

When used in conjunction with an appliance that connects to the remote debugging port, it enables interaction with the document, which is particularly useful for testing and CI automation, where a graphical environment is not necessary to get results or isn't available.

## Syntax

- `chrome --headless $SWITCHES https://stackoverflow.com`

## Remarks

Historically, others have succeeded at using Chrome as a headless browser by running the process in a [hidden display](#).

Invoking Chrome directly is not the only available option for using it as a headless browser. The [Embedder API](#) also allows one to use Chrome directly from the application's process.

## Examples

### Taking screenshots

The following will produce a PNG image in the current directory of the loaded page.

```
chrome --headless --screenshot https://stackoverflow.com
```

### Interacting with documents

Using the `--remote-debugging-port` to expose a debugger accessible over HTTP is one way appliances can connect and interact with the document using the Chrome Debugging Protocol.

```
chrome --headless --remote-debugging-port=9222 https://stackoverflow.com
```

You can then navigate to <http://localhost:9222> and use Chrome DevTools interactively.

**Read Headless browsing online:** <https://riptutorial.com/google-chrome/topic/8619/headless-browsing>
