Use the content presented in this book at your own risk; it is not guaranteed to be correct nor accurate, please send your feedback and corrections to info@zzzprojects.com

Capítulo 1: Empezando con Homebrew

Examples

Instalación

Homebrew se puede instalar usando el siguiente comando en el terminal:

```
/usr/bin/ruby -e "$(curl -fsSL
https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

Se ejecuta como el usuario actual; no necesitas usar `sudo`. El script [se puede ver en línea](#) e imprimirá un resumen de lo que hará antes de hacerlo.

Luego, debe agregar `/usr/local/bin` a su `PATH` si aún no está allí. Ejecute el siguiente comando para verificar:

```
echo $PATH
```

Si no ve `/usr/local/bin` en la salida, tendrá que agregarlo. Abra su archivo `~/.bash_profile` en un editor y agregue las siguientes líneas al final:

```
# Add Homebrew prefix to the PATH
export PATH="/usr/local/bin:$PATH"
```

Ahora ejecuta `source ~/.bash_profile`. El comando `brew` ahora debería estar disponible:

```
brew help
```

Sintaxis

Ejemplo de uso:

```
brew search [TEXT|/REGEX/]
brew (info|home|options) [FORMULA...]
brew install FORMULA...
brew update
brew upgrade [FORMULA...]
brew uninstall FORMULA...
brew list [FORMULA...]
```

Solución de problemas:

```
brew config
brew doctor
brew install -vd FORMULA
```

Desarrolladores: brew create [URL [--no-fetch]] brew edit [FORMULA ...]

Ayuda adicional: man brew brew help [COMMAND] brew home
