# Chapter 1: Getting started with ReactiveCocoa

## Remarks

This section provides an overview of what reactive-cocoa is, and why a developer might want to use it.

It should also mention any large subjects within reactive-cocoa, and link out to the related topics. Since the Documentation for reactive-cocoa is new, you may need to create initial versions of those related topics.

## Versions

Version		Release date
5.0.0	(Swift 3, Xcode 8.x, <a href="#">release notes</a> )	2017-01-16
4.2.2	(Swift 2.2 & 2.3, Xcode 7.3 & 8.0, <a href="#">release notes</a> )	2016-07-18

## Examples

### Installation or Setup

ReactiveCocoa supports macOS 10.9+, iOS 8.0+, watchOS 2.0+, and tvOS 9.0+.

## Carthage

If you use Carthage to manage your dependencies, simply add ReactiveCocoa to your Cartfile:

```
github "ReactiveCocoa/ReactiveCocoa" ~> 5.0
```

If you use Carthage to build your dependencies, make sure you have added

`ReactiveCocoa.framework`, `ReactiveSwift.framework`, and `Result.framework` to the "Linked Frameworks and Libraries" section of your target, and have included them in your Carthage framework copying build phase.

## CocoaPods

If you use CocoaPods to manage your dependencies, simply add ReactiveCocoa to your Podfile:

```
pod 'ReactiveCocoa', '~> 5.0.0'
```

# Git submodule

Add the ReactiveCocoa repository as a submodule of your application's repository.

Run

```
git submodule update --init --recursive
```

from within the ReactiveCocoa folder.

Drag and drop `ReactiveCocoa.xcodeproj`, `Carthage/Checkouts/ReactiveSwift/ReactiveSwift.xcodeproj`, and `Carthage/Checkouts/Result/Result.xcodeproj` into your application's Xcode project or workspace.

On the "General" tab of your application target's settings, add `ReactiveCocoa.framework`, `ReactiveSwift.framework`, and `Result.framework` to the "Embedded Binaries" section.

If your application target does not contain Swift code at all, you should also set the `EMBEDDED_CONTENT_CONTAINS_SWIFT` build setting to "Yes".
