Use the content presented in this book at your own risk; it is not guaranteed to be correct nor accurate, please send your feedback and corrections to info@zzzprojects.com

Chapter 1: Getting started with selenium-grid

Remarks

This section provides an overview of what selenium-grid is, and why a developer might want to use it.

It should also mention any large subjects within selenium-grid, and link out to the related topics. Since the Documentation for selenium-grid is new, you may need to create initial versions of those related topics.

Examples

What is Selenium Grid?

Selenium-Grid is a configuration of *Hub & Node* which allows you to run your tests on different machines against different browser combinations in parallel. That is, running multiple tests at the same time against *different machines* running *different browsers* on *different operating systems*. In other words Selenium Grid supports running the tests in **Distributed Environment**.

When to use it

- **To run your tests against multiple browsers, multiple versions of browser, and browsers running on different operating systems.** This will ensure that the application you are testing is fully compatible with a wide range of browser-O.S combinations.
- **To reduce the time it takes for the test suite to complete a test pass.** Lets say you setup your Grid to run 8 tests at a time, your execution would finish 8 times faster as compared to your normal run.

Selenium-Grid is used to speed up the execution of a test by using multiple machines to run tests in parallel.

What is a Hub & Node?

The Hub

- The *Hub* is the main engine/central point of the entire configuration, point where all the nodes are connected.
- *Hub* should run only on a single machine.
- There should only be 1 hub running where all the tests are loaded.
- Tests will be run on the machines where hub is running, but you can see the browsers on the node machines.

The Nodes

- Nodes are the instances (machines) which will execute the tests that are loaded on the hub.

- There are no limitations on Node machines, a user can setup n number of Nodes.
- Nodes can be launched on different machines with different OS and browser combinations.
- Machines running the nodes can be of different/same configurations as of Hub Machine.

Chapter 2: Selenium Grid Configuration

Remarks

Downloads

This chapter contains useful downloads like the webdrivers and link to browsers

Drivers

Place all the drivers in your path variable

- [Chrome driver](#)
- [FireFox driver](#)
- [Microsoft Edge driver](#)
- [Opera driver](#)

Browsers

- [Chrome](#)
- [FireFox](#)
- [Microsoft Edge](#)
- [Opera](#)

Examples

Installation or Setup

Before setting up a Selenium grid you need to make sure you have *Java* installed and configured in your computer's environment path.

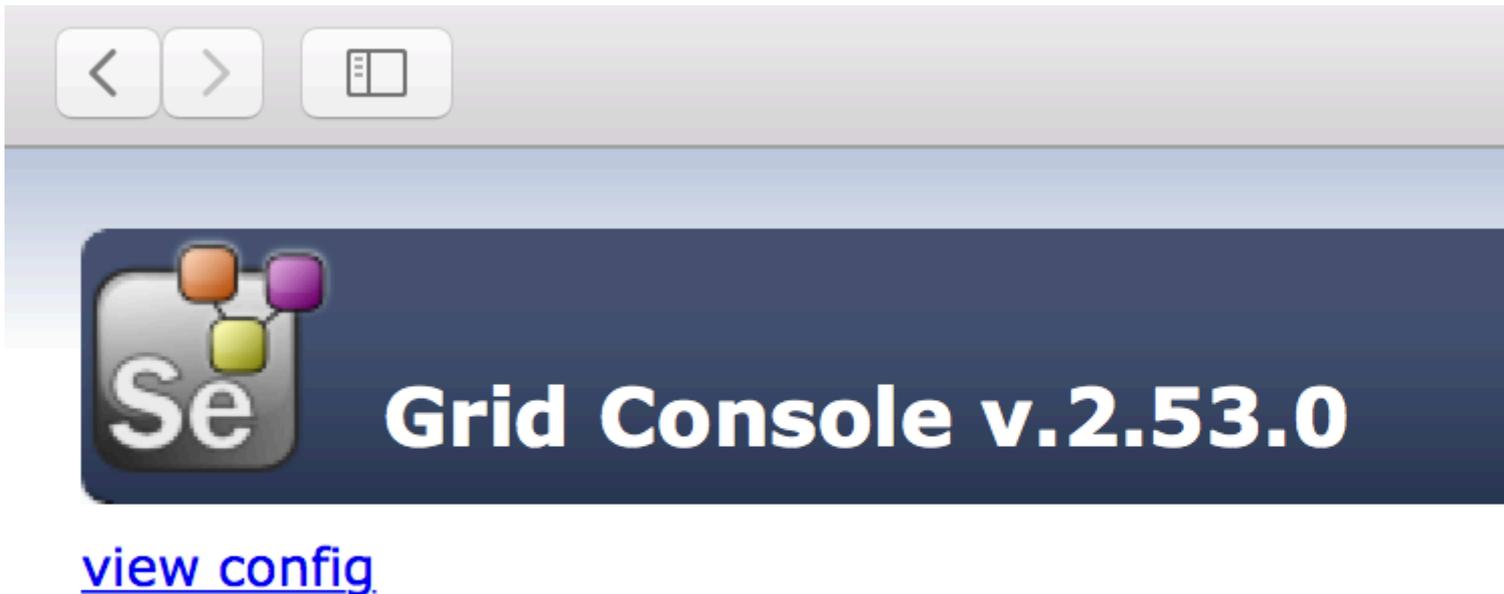

Configure the Hub

- Download latest stable [Selenium Server](#) version.
- Start the command prompt and navigate to the location in which you placed the Selenium server jar file.
- Type: (FYI: your version number may be different than mine) `java -jar selenium-server-standalone-2.53.0.jar -role hub`
- It should now look something like this:

```
→ jars java -jar selenium-server-standalone-2.53.0.jar
18:47:47.018 INFO - Launching Selenium Grid hub
2017-01-03 18:47:47.524:INFO::main: Logging initialized
18:47:47.533 INFO - Will listen on 4444
18:47:47.566 INFO - Will listen on 4444
2017-01-03 18:47:47.569:INFO:osjs.Server:main: jetty-
2017-01-03 18:47:47.590:INFO:osjsh.ContextHandler:mai
2017-01-03 18:47:47.612:INFO:osjs.ServerConnector:mai
2017-01-03 18:47:47.612:INFO:osjs.Server:main: Starte
18:47:47.613 INFO - Nodes should register to http://1
18:47:47.613 INFO - Selenium Grid hub is up and runni
```

Basically what happened is selenium webserver started and is now listening on a port - in this case default **4444** (FYI - This port number can be changed by passing the *-port* parameter followed by the port number on which you want to run the server).

- Now open a browser and navigate to <http://localhost:4444/grid/console>
- If everything is working, server should come up and you would see something like this:

Next, we need to setup some node machines.

Configure the Nodes

- Just like we downloaded [Selenium Server](#) for **Hub**, we also need to download it on all our **Node** machines.
- Once you have the Selenium-server jar file on the node machine, navigate to the directory where jar is downloaded and open up cmd prompt.
- Type: `java -jar selenium-server-standalone-2.53.0.jar -role node -hub http://hubIP:4444/grid/register`
 - **hubIP** :- in case the hub and nodes are running on a different machine
 - **localhost** :- in case the hub and nodes are running on same machine

As you can see the node is now registered to the hub, by default node starts on **-port 5555** but you can change the same by using **-port** parameter followed by port number.

```
→ jars java -jar selenium-server-standalone-2.53.0.jar
21:28:54.200 INFO - Launching a Selenium Grid node
21:28:54.525 INFO - Java: Oracle Corporation 25.31-b0
21:28:54.525 INFO - OS: Mac OS X 10.12.2 x86_64
21:28:54.529 INFO - v2.53.0, with Core v2.53.0. Built
21:28:54.569 INFO - Driver provider org.openqa.selenium
registration capabilities Capabilities [{ensureCleanS
21:28:54.569 INFO - Driver provider org.openqa.selenium
registration capabilities Capabilities [{browserName=
21:28:54.569 INFO - Driver class not found: com.opera
21:28:54.569 INFO - Driver provider com.opera.core.sy
21:28:54.571 INFO - Driver class not found: org.openc
21:28:54.571 INFO - Driver provider org.openqa.selenium
21:28:54.604 INFO - Selenium Grid node is up and read
21:28:54.628 INFO - Starting auto registration thread
21:28:54.628 INFO - Registering the node to the hub:
21:28:54.650 INFO - The node is registered to the hub
```

If everything works as expected you should now see the IP address of the node you just started and registered in the hub console view:

Grid Console v.2.53.0

DefaultRemoteProxy (version : 2.53.0)

id : http://[redacted].1[redacted].1[redacted]:5555, OS : MAC

Browsers

Configuration

Remote Control (legacy)

v:

v:

v:

WebDriver

v:

v:

v:

[view config](#)

Things to Notice

- If we don't specify the `seleniumProtocol`, Node will be registered with both Remote Control (Legacy) and Webdriver Protocol (as seen in the screenshot above).
- If the browsers type and number of instances aren't mentioned, Node will launch 5 instance

of Firefox, 5 Instance of Chrome and 1 Instance of IE driver.

That's all you would be needing to do for an up and running Selenium Grid.

Json configuration

An example configuration for a hub:

```
java -jar selenium-server-standalone-<version>.jar -role hub -hubConfig hubConfig.json
```

```
{
  "_comment" : "Configuration for Hub - hubConfig.json",
  "host": ip,
  "maxSessions": 5,
  "port": 4444,
  "cleanupCycle": 5000,
  "timeout": 300000,
  "newSessionWaitTimeout": -1,
  "servlets": [],
  "prioritizer": null,
  "capabilityMatcher": "org.openqa.grid.internal.utils.DefaultCapabilityMatcher",
  "throwOnCapabilityNotPresent": true,
  "nodePolling": 180000,
  "platform": "WINDOWS"
}
```

An example configuration for a node

```
java -jar selenium-server-standalone-<version>.jar -role node -nodeConfig nodeConfig.json
```

```
{
  "capabilities":
  [
    {
      "browserName": "opera",
      "platform": "WINDOWS",
      "maxInstances": 5,
      "seleniumProtocol": "WebDriver",
      "webdriver.opera.driver": "C:/Selenium/drivers/operadriver.exe",
      "binary": "C:/Program Files/Opera/44.0.2510.1159/opera.exe"
    },
    {
      "browserName": "chrome",
      "platform": "WINDOWS",
      "maxInstances": 5,
      "seleniumProtocol": "WebDriver",
      "webdriver.chrome.driver": "C:/Selenium/drivers/chromedriver.exe",
      "binary": "C:/Program Files/Google/Chrome/Application/chrome.exe"
    },
    {
      "browserName": "firefox",
      "platform": "WINDOWS",
      "maxInstances": 5,
      "seleniumProtocol": "WebDriver",
      "webdriver.gecko.driver": "C:/Selenium/drivers/geckodriver.exe",
      "binary": "C:/Program Files/Mozilla Firefox/firefox.exe"
    }
  ],
}
```

```

"proxy": "org.openqa.grid.selenium.proxy.DefaultRemoteProxy",
"maxSession": 5,
"port": 5555,
"register": true,
"registerCycle": 5000,
"hub": "http://localhost:4444",
"nodeStatusCheckTimeout": 5000,
"nodePolling": 5000,
"role": "node",
"unregisterIfStillDownAfter": 60000,
"downPollingLimit": 2,
"debug": false,
"servlets" : [],
"withoutServlets": [],
"custom": {}
}

```

Configuration and useage in C#

Configuration

In the following paragraphs there will be an example per browser for the configuration in Json and setup in C#.

This example expects you to have all the drivers in your path variable and browsers installed.

Microsoft Edge

C# code to create a remote webdriver

```

// Defining webdriver variable
RemoteWebDriver _webDriver;
// Creating Capabilities and chosing browser
capabiliteiten = DesiredCapabilities.Edge();
// Setting platform
capabiliteiten.Platform = new Platform(PlatformType.Windows);
// Requesting remote webdriver
_webDriver = new RemoteWebDriver(_gridServerUri, capabiliteiten);

```

Node configuration in Json

```

{
  "browserName": "MicrosoftEdge",
  "platform": "WINDOWS",
  "maxIstances": 1,
  "seleniumProtocol": "WebDriver"
}

```

Chrome

C# code to create a remote webdriver

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities and choosing browser
capabilities = DesiredCapabilities.Chrome();
// Setting platform
capabilities.Platform = new Platform(PlatformType.Windows);
// Requesting remote webdriver
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{
  "browserName": "chrome",
  "platform": "WINDOWS",
  "maxInstances": 5,
  "seleniumProtocol": "WebDriver"
}
```

Firefox

C# code to create a remote webdriver

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities and choosing browser
capabilities = DesiredCapabilities.Firefox();
// Setting platform
capabilities.Platform = new Platform(PlatformType.Windows);
// Requesting remote webdriver
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{
  "browserName": "firefox",
  "platform": "WINDOWS",
  "maxInstances": 5,
  "seleniumProtocol": "WebDriver"
}
```

Opera

C# code to create a remote webdriver **This is for OperaChromium**

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities
capabilities = new DesiredCapabilities();
// Setting platform
capabilities.Platform = new Platform(PlatformType.Windows);
// Choosing browser
capabilities.SetCapability(CapabilityType.BrowserName, "operablank");
// Requesting remote webdriver
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{
  "browserName": "operablink",
  "platform": "WINDOWS",
  "maxInstances": 5,
  "seleniumProtocol": "WebDriver"
}
```

Platform type can be one of the following:

- PlatformType.Android;
- PlatformType.Any;
- PlatformType.Linux;
- PlatformType.Mac;
- PlatformType.Unix;
- PlatformType.Vista;
- PlatformType.Windows;
- PlatformType.WinNT;
- PlatformType.XP;

Configuration Json and C# multiple browsers

Configuration

In the following paragraphs there will be an example per browser for the configuration in Json and setup in C#.

This example expects you to have all the browsers installed and the drivers in your path variable

Microsoft Edge

C# code to create a remote webdriver

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities and choosing browser
capabilities = DesiredCapabilities.Edge();
// Setting platform
capabilities.Platform = new Platform(PlatformType.Windows);
// Requesting remote webdriver
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{
  "browserName": "MicrosoftEdge",
  "platform": "WINDOWS",
  "maxInstances": 1,
  "seleniumProtocol": "WebDriver"
}
```

Chrome

C# code to create a remote webdriver

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities and choosing browser
capabilities = DesiredCapabilities.Chrome();
// Setting platform
capabilities.Platform = new Platform(PlatformType.Windows);
// Requesting remote webdriver
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{
  "browserName": "chrome",
  "platform": "WINDOWS",
  "maxInstances": 5,
  "seleniumProtocol": "WebDriver"
}
```

Firefox

C# code to create a remote webdriver

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities and choosing browser
capabilities = DesiredCapabilities.Firefox();
// Setting platform
capabilities.Platform = new Platform(PlatformType.Windows);
// Requesting remote webdriver
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{
  "browserName": "firefox",
  "platform": "WINDOWS",
  "maxInstances": 5,
  "seleniumProtocol": "WebDriver"
}
```

Opera

C# code to create a remote webdriver

```
// Defining webdriver variable
RemoteWebDriver _webdriver;
// Creating Capabilities
capabilities = new DesiredCapabilities();
// Setting platform
```

```
capabilities.Platform = new Platform(PlatformType.Windows);  
// Chosing browser  
capabilities.SetCapability(CapabilityType.BrowserName, "operablink");  
// Requesting remote webdriver  
_webdriver = new RemoteWebDriver(_gridServerUri, capabilities);
```

Node configuration in Json

```
{  
  "browserName": "operablink",  
  "platform": "WINDOWS",  
  "maxInstances": 5,  
  "seleniumProtocol": "WebDriver"  
}
```

Platform type can be one of the following:

```
PlatformType.Android;  
PlatformType.Any;  
PlatformType.Linux;  
PlatformType.Mac;  
PlatformType.Unix;  
PlatformType.Vista;  
PlatformType.Windows;  
PlatformType.WinNT;  
PlatformType.XP;
```
