# Chapter 1: Getting started with sorting

## Remarks

This section provides an overview of what sorting is, and why a developer might want to use it.

It should also mention any large subjects within sorting, and link out to the related topics. Since the Documentation for sorting is new, you may need to create initial versions of those related topics.

## Examples

### Installation or Setup

Detailed instructions on getting sorting set up or installed.

Read **Getting started with sorting** online: <https://riptutorial.com/sorting/topic/5842/getting-started-with-sorting>

# Chapter 2: Quick Sort

## Examples

### Python

The below image shows the working of a quick sort.

Below example shows the working program for quick sort in python:

```
def quickSort(alist):
    quickSortHelper(alist,0,len(alist)-1)

def quickSortHelper(alist,first,last):
    if first<last:
        splitpoint = partition(alist,first,last)
        quickSortHelper(alist, first, splitpoint-1)
        quickSortHelper(alist, splitpoint+1, last)

def partition(alist,first,last):
    pivotvalue = alist[first]
```

```

leftmark = first+1
rightmark = last

done = False
while not done:

    while leftmark <= rightmark and alist[leftmark] <= pivotvalue:
        leftmark = leftmark + 1

    while alist[rightmark] >= pivotvalue and rightmark >= leftmark:
        rightmark = rightmark -1

    if rightmark < leftmark:
        done = True
    else:
        temp = alist[leftmark]
        alist[leftmark] = alist[rightmark]
        alist[rightmark] = temp

temp = alist[first]
alist[first] = alist[rightmark]
alist[rightmark] = temp

return rightmark

alist = [54,26,93,17,77,31,44,55,20]
print("Input:")
print(alist)
quickSort(alist)
print("Output:")
print(alist)

```

Below is the output of the code:

```

tejusadi@tejusadi-MS-7693:/tmp$ vim quickSort.py
tejusadi@tejusadi-MS-7693:/tmp$ python quickSort.py
Input:
[54, 26, 93, 17, 77, 31, 44, 55, 20]
Output:
[17, 20, 26, 31, 44, 54, 55, 77, 93]

```

Complexity of the above logic is :  **$O(n \log n)$**

# Chapter 3: Selection

## Remarks

In computer science, a selection sort is a sorting algorithm, specifically an in-place comparison sort. It has  $O(n^2)$  time complexity, making it inefficient on large lists, and generally performs worse than the similar insertion sort. Selection sort is noted for its simplicity, and it has performance advantages over more complicated algorithms in certain situations, particularly where auxiliary memory is limited.

The below image shows how the selection sort works-

The array, before the selection sort operation begins.

The smallest number (12) is swapped into the first element in the structure.

In the data that remains, 16 is the smallest; and it does not need to be moved.

26 is the next smallest number, and it is swapped into the third position.

42 is the next smallest number; it is already in the correct position.

53 is the smallest number in the data that remains; and it is swapped to the appropriate position.

Of the two remaining data items, 77 is the smaller; the items are swapped. *The selection sort is now complete.*

Below pseudo code helps in creating a program(in any language) or understanding selection sort.

```
procedure selection sort
list  : array of items
n     : size of list

for i = 1 to n - 1
/* set current element as minimum*/
  min = i

  /* check the element to be minimum */
```

```

for j = i+1 to n
  if list[j] < list[min] then
    min = j;
  end if
end for

/* swap the minimum element with the current element*/
if indexMin != i then
  swap list[min] and list[i]
end if

end for

end procedure

```

Advantages :

- it's too simple to understand
- it performs well on a small list
- no additional temporary storage is required beyond what is needed to hold the original list

## Examples

### Selection Sort (Python)

Animation to show how selection sort works

The below example shows selection sort in Python

```

def sort_selection(my_list):
    for pos_upper in xrange( len(my_list)-1, 0, -1):

```

```

max_pos = 0
for i in xrange(1, pos_upper + 1):
    if(my_list[i] > my_list[max_pos]):
        max_pos = i
        print "resetting max_pos = " + str(max_pos)

    my_list[pos_upper], my_list[max_pos] = my_list[max_pos], my_list[pos_upper]
    print "pos_upper: " + str(pos_upper) + " max_pos: " + str(max_pos) + " my_list: " +
str(my_list)

return my_list

if __name__ == "__main__":

    my_list = [54,26,93,17,77,31,44,55,20]
    print "my_list: " + str(my_list)
    print sort_selection(my_list)

```

## Output of the program:

```

my_list: [54, 26, 93, 17, 77, 31, 44, 55, 20]
resetting max_pos = 2
pos_upper: 8 max_pos: 2 my_list: [54, 26, 20, 17, 77, 31, 44, 55, 93]
resetting max_pos = 4
pos_upper: 7 max_pos: 4 my_list: [54, 26, 20, 17, 55, 31, 44, 77, 93]
resetting max_pos = 4
pos_upper: 6 max_pos: 4 my_list: [54, 26, 20, 17, 44, 31, 55, 77, 93]
pos_upper: 5 max_pos: 0 my_list: [31, 26, 20, 17, 44, 54, 55, 77, 93]
resetting max_pos = 4
pos_upper: 4 max_pos: 4 my_list: [31, 26, 20, 17, 44, 54, 55, 77, 93]
pos_upper: 3 max_pos: 0 my_list: [17, 26, 20, 31, 44, 54, 55, 77, 93]
resetting max_pos = 1
pos_upper: 2 max_pos: 1 my_list: [17, 20, 26, 31, 44, 54, 55, 77, 93]
resetting max_pos = 1
pos_upper: 1 max_pos: 1 my_list: [17, 20, 26, 31, 44, 54, 55, 77, 93]
[17, 20, 26, 31, 44, 54, 55, 77, 93]

```

7

Below example shows selection sort in ascending order:

```
public class MySelectionSort {  
  
    public static int[] doSelectionSort(int[] arr){  
  
        for (int i = 0; i < arr.length - 1; i++)  
        {  
            int index = i;  
            for (int j = i + 1; j < arr.length; j++)  
                if (arr[j] < arr[index])  
                    index = j;  
  
            int smallerNumber = arr[index];  
            arr[index] = arr[i];  
            arr[i] = smallerNumber;  
        }  
        return arr;  
    }  
}
```

I've written a sample `main()` method to show the output of the selection sort:

```
public static void main(String a[]){  
  
    int[] arr1 = {10,34,2,56,7,67,88,42};  
    int[] arr2 = doSelectionSort(arr1);  
    for(int i:arr2){  
        System.out.print(i);  
        System.out.print(", ");  
    }  
}
```

Output of the program :

2, 7, 10, 34, 42, 56, 67, 88

Below example shows selection sort in descending order:

```
public static void doDescendingSelectionSort ( int [ ] num )
{
    int i, j, first, temp;
    for ( i = num.length - 1; i > 0; i - - )
    {
        first = 0;    //initialize to subscript of first element
        for(j = 1; j <= i; j ++ )    //locate smallest element between positions 1 and i.
        {
            if( num[ j ] < num[ first ] )
                first = j;
        }
        temp = num[ first ];    //swap smallest found with element in position i.
        num[ first ] = num[ i ];
        num[ i ] = temp;
    }
}
```
