Given the user is on Login screen  
When the user enters 'user' as username  
And the user enters 'pass' as password  
And the user taps the Login button  
Then the app shows the loading indicator  
And the app makes an API call for authentication
```

```
Scenario: trying to log in empty username  
Given the user is on Login screen  
When the user enters ' ' as username  
And the user enters 'pass' as password  
And the user taps the Login button  
Then the app shows an error message saying 'Please, enter correct username and password'  
And the app doesn't make an API call for authentication
```

About this API

Add maps based on Google Maps data to your Android application with the Google Maps Android API. The API provides map display and response to user gestures such as clicks and drags.

Using credentials with this API

Using an API key

To use this API you need an API key. An API key identifies your project to check quotas and access. Go to the Credentials page to get an API key. You'll need a key for each platform, such as Web, Android, and iOS. [Learn more](#)

8. Android " ?" API " " 4 SHA1 API .

The screenshot shows the Google APIs console interface. On the left, the 'API Manager' sidebar is visible with 'Credentials' selected. The main content area is titled 'Add credentials to your project' and shows a multi-step wizard. Step 1 is 'Find out what kind of credentials you need' (calling Google Maps Android API from Android). Step 2 is 'Create an API key', which is the current step. It includes a text input for 'Name' (MapExample Maps), a section for 'Restrict usage to your Android apps' (optional) with a terminal command: `$ keytool -list -v -keystore mystore.keystore`, and two input fields for 'Package name' (documentation.mapexample) and 'SHA-1 certificate fingerprint' (57:A1:E5:23:CE:49:2F:17:8D:8A). A blue button labeled 'Create API key' is highlighted with a red arrow. Step 3 is 'Get your credentials'. A 'Cancel' button is at the bottom.

Xamarin Studio .Droid -> AndroidManifest.xml .

9. API ("") AndroidManifest.xml .

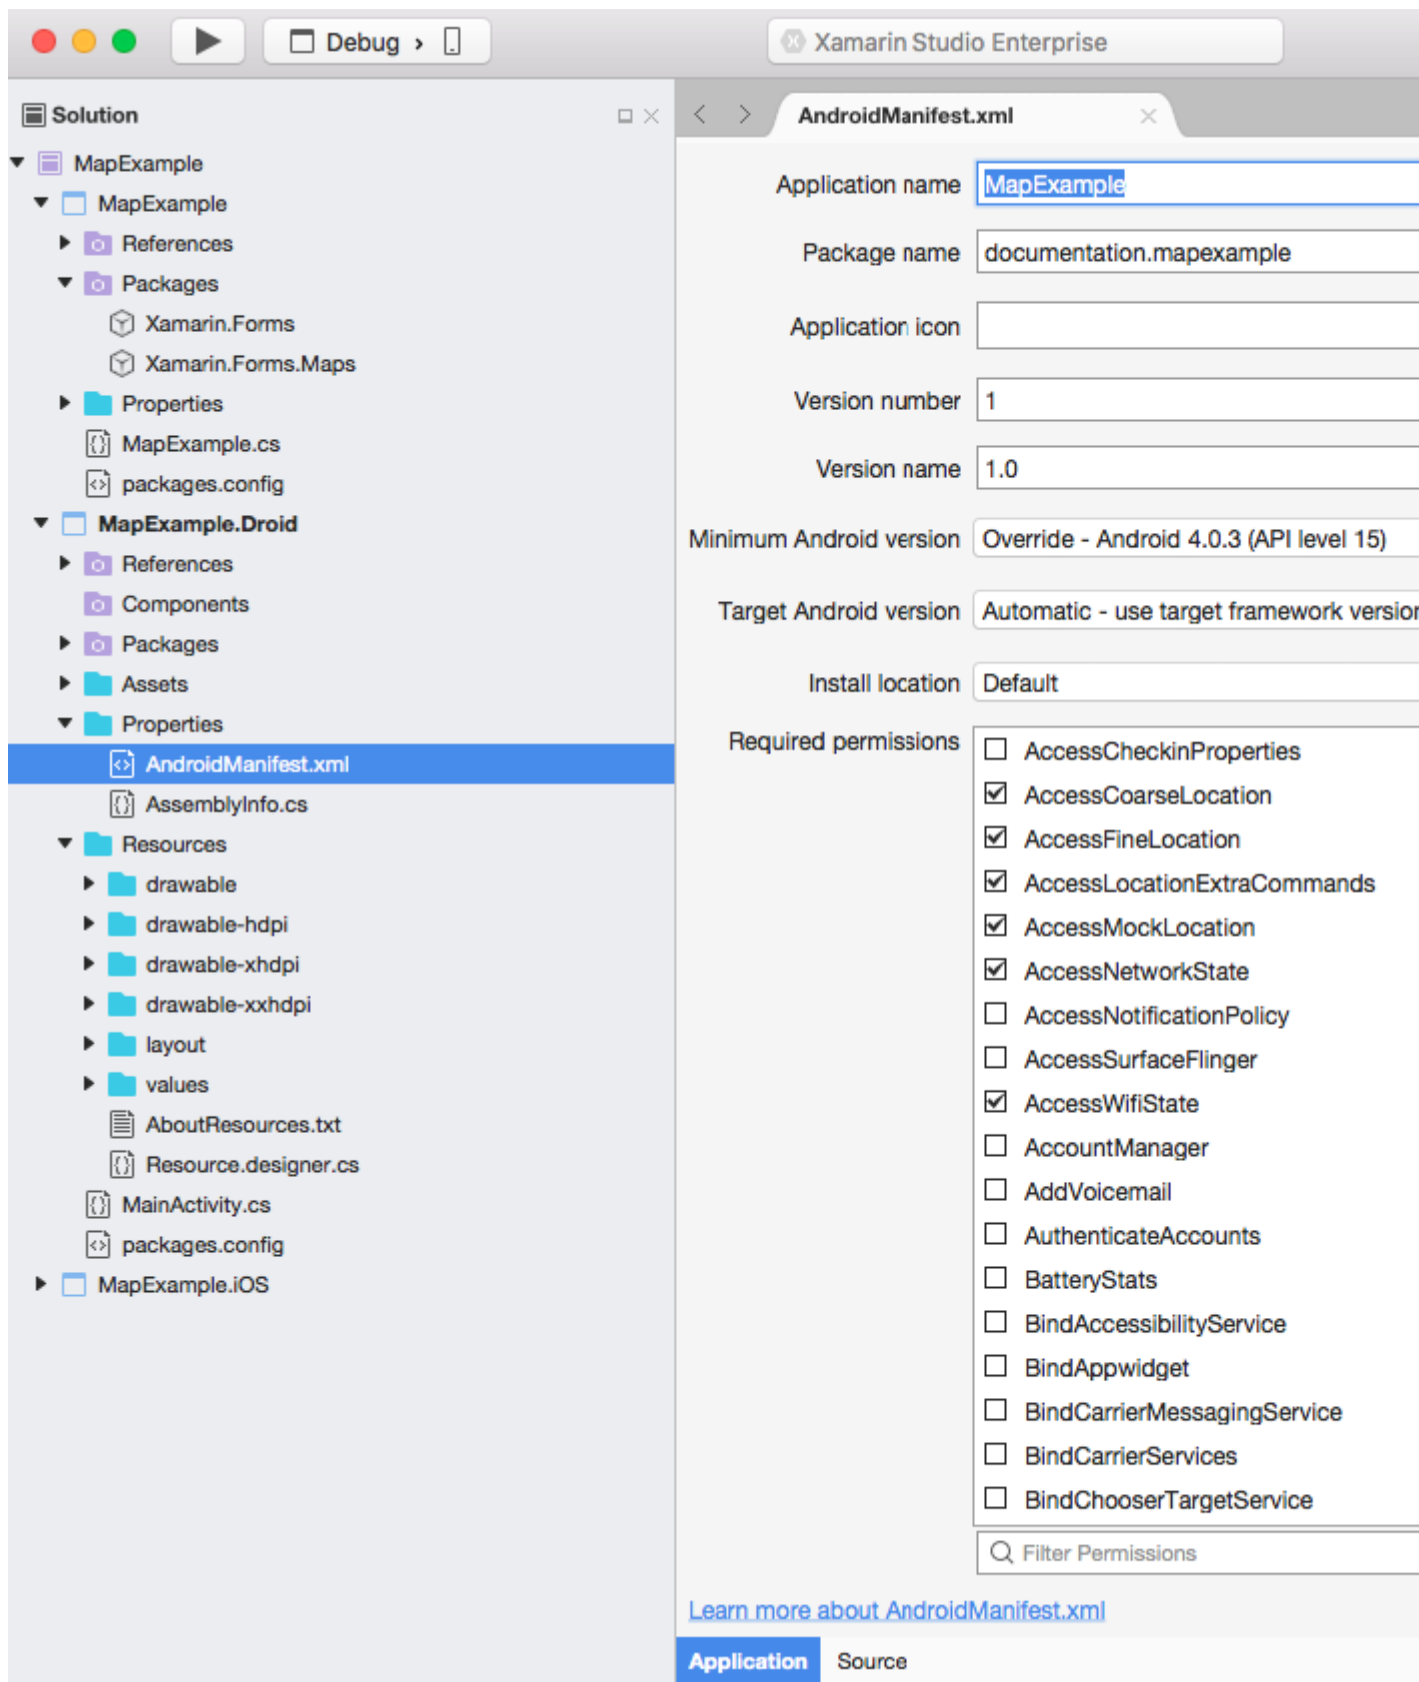

The screenshot shows the Google APIs console interface. The left sidebar contains a menu with 'API Manager' selected. The main content area is titled 'Add credentials to your project' and shows a three-step wizard. Step 1 is 'Find out what kind of credentials you need' (calling Google Maps Android API from Android). Step 2 is 'Create an API key' (created API key 'MapExample Maps'). Step 3 is 'Get your credentials', which displays the API key 'AIzaSyBAG8X-t4p0IDDp3q5Ph45jKUIVjo_RnxU'. At the bottom of the wizard, there are 'Done' and 'Cancel' buttons. A red arrow points to the 'Done' button.

Examples

iOS

1. .
2. Apple .
3. (AWS, Azure..etc) . **AWS** .

```
public override bool FinishedLaunching(UIApplication app, NSDictionary options)
{
    global::Xamarin.Forms.Forms.Init();

    //after typical Xamarin.Forms Init Stuff

    //variable to set-up the style of notifications you want, iOS supports 3 types

    var pushSettings = UIUserNotificationSettings.GetSettingsForTypes(
        UIUserNotificationType.Alert |
        UIUserNotificationType.Badge |
        UIUserNotificationType.Sound,
        null );

    //both of these methods are in iOS, we have to override them and set them up
    //to allow push notifications

    app.RegisterUserNotificationSettings(pushSettings); //pass the supported push
    notifications settings to register app in settings page
}

public override async void RegisteredForRemoteNotifications(UIApplication application, NSData
token)
{
```

```

    AmazonSimpleNotificationServiceClient snsClient = new
AmazonSimpleNotificationServiceClient("your AWS credentials here");

    // This contains the registered push notification token stored on the phone.
    var deviceToken = token.Description.Replace("<", "").Replace(">", "").Replace(" ",
    "");

    if (!string.IsNullOrEmpty(deviceToken))
    {
        //register with SNS to create an endpoint ARN, this means AWS can message your
phone
        var response = await snsClient.CreatePlatformEndpointAsync(
            new CreatePlatformEndpointRequest
            {
                Token = deviceToken,
                PlatformApplicationArn = "yourARNwouldgohere" /* insert your platform
application ARN here */
            });

        var endpoint = response.EndpointArn;

        //AWS lets you create topics, so use subscribe your app to a topic, so you can
easily send out one push notification to all of your users
        var subscribeResponse = await snsClient.SubscribeAsync(new SubscribeRequest
            {
                TopicArn = "YourTopicARN here",
                Endpoint = endpoint,
                Protocol = "application"
            });
    }
}
